

ABSTRACT OF THE DISCLOSURE

An electrical connector (1) includes an insulative housing (2), a conductive shield (3) enclosing the insulative housing and a contact insert (4, 4'). The contact insert has a number of electrical contacts (41-48, 41'-48') arranged into differential pairs. A first electrical contact of a first differential pair electrically couples with a first electrical contact of a second differential pair to balance an electrical coupling between a second electrical contact of the first differential pair and the first electrical contact of the second differential pair.
